

Database Backup and Recovery Procedure

Full backups of the production database are taken nightly at 02:00 UTC and retained for 14 days. Incremental backups run every 4 hours. Backup integrity is verified weekly by restoring to a staging environment and running a checksum comparison against the source. Recovery Point Objective (RPO) is 4 hours and Recovery Time Objective (RTO) is 2 hours.

Database Backup and Recovery Procedure: Restore Steps

To restore from backup, first stop all application connections to the database. Locate the most recent full backup and any incremental backups taken after it. Apply the full backup first, then apply incrementals in chronological order. After restore, run the validation script `validate_restore.sql` before reopening connections to applications.
